Managing Splunk with Puppet

Presented by Tom Kreiner

to Baltimore Splunk User Groups on

January 31, 2022

Who Am I?

- Splunk professional since 2012
- Splunk Enterprise Certified Architect and Core Certified Consultant

ITT

- Joined Aplura in April 2021
- When not Splunking:
 - Husband, and father of two kids
 - Sailing
 - BBQ/grilling/smoking
 - Amateur radio

CDdump

APLURA Many Solutions, One Goal.

Agenda

- Understand how Puppet can be used to install and configure Splunk.
- Learn benefits of this tool for both production and test environments.
- Discuss lessons learned of using Puppet, or any configuration management tool, with Splunk.

WARNING – Lots of Information Ahead!!!

We are going to cover A LOT of information in the next hour. Use this session as a guide.

32616	Splunkd	%CPU USER		0 used. 615976 avail New

I Am Not a Puppet Master!!!

I have been working with Puppet for several months and I have learned A LOT!!!

I still have A LOT to learn!!!

Just like Splunk, there are lots of ways to solve the same problem.

What is Puppet?

"Puppet is a tool that helps you manage and automate the configuration of servers."

-- Introduction to Puppet, puppet.com

What is Benefit of Puppet with Splunk?

- Consistent install and configuration of Splunk.
- Time saving administration of servers.
- Easy provisioning of both production and test environments.
- Automation of upgrades.
- When managed in a repo, you gain history and change management of your configurations.

My Environment – Management Server

mgmt.linuxdev.local

- Router / Gateway
- DHCP
- DNS
- Package repository
- Puppet Server

32616	Splunkd	%CPU USER		0 used	615976 avail Nor

1602	Vim	0.3 dan	1028	7:31.12 1.8 0:00.08 0.6	20 0 548272 18072 20 0 152828 6248	5584 5 12 connect 25 3 connect 25 3 connect	Many Solutions, One Goal.

Important Concepts - Facter

Facter is a tool that installs with the Puppet agent that provides facts about a machine. Facts could include:

- OS information
- Disk configuration
- Network configuration
- Custom facts
- And so much more...

```
architecture => "amd64",
distro => {
  codename => "focal",
  description => "Ubuntu 20.04.3 LTS",
  id => "Ubuntu",
  release => {
    full => "20.04",
    major => "20.04"
family => "Debian",
hardware \Rightarrow "x86_64",
name => "Ubuntu",
release => {
  full => "20.04",
 major => "20.04"
},
selinux => {
  enabled => false
```

Important Concepts - Hiera

Hiera is a hierarchical configuration structure that is defined within the Puppet server to provide configuration settings. Facts from Facter are often used to define the structure. (NOTE: Think of Splunk app precedence with conf files.)

hierarchy:

- name: "Encrypted data"
 - lookup_key: eyaml_lookup_key
 - paths:
 - "nodes/%{trusted.certname}.yaml"
 - "os/%{facts.os.name}.yaml"
 - "group/%{facts.hostname_info.group}.yaml"
 - common.yaml

32616	Splunkd	%CPU USER		0 used. 615976 avail the	
32695	tcpdump	0.3 splunk	UID 1000	TIME+ SMEM PR NI VIRT	APLURA
590	named	0.3 tcpdump	72	0:02.45 0.7 20 0 135356 43956 8940 5 1 1000 stiller state	
1602	Vim	0.3 dan	1028	7:31.12 1.8 20 0 548272 18072 5464 5 32680 77 training 77 Training 77 Training 77 Training 77 Training 78 Training	Many Solutions, One Goal.

Important Concepts -Hiera

Here is a sample tree structure of Hiera data files that shows specific files created for my environment.

32616	Splupkd	%CPU USER		0 used. 615976 gvail he	
32695	tcpdump	0.3 splunk	UID	TIME+ SMEN PR NT HTTP	APLURA
590	named	0.3 tcpdump	72	0:02.80 4.3 20 0 135356 43956 8946 5 1 100 8058 300 00 000	
1602	Vim	0.3 dan	25 1028	7:31.12 1.8 20 0 548272 18072 5564 5 32600 72 toping 72 3 toping 7	Many Solutions, One Goal.

Important Concepts - Resource

A Puppet resource is a foundational object to define a configuration.

A resource is defined by a resource type and a name.

f	ile { '/0	opt,	<pre>/splunk/etc/system/local/user-seed.conf':</pre>
	ensure	=>	file,
	owner	=>	'splunk',
	group	=>	'splunk',
	mode	=>	'0644',
	content	=>	<pre>template('splunk/opt/splunk/etc/system/local/user-seed.conf.erb'),</pre>
3			

<pre>user { 'suadu</pre>	min'	:
ensure	=>	present,
groups	=>	\$admin_groups,
comment	=>	'Test Sudo Admin User',
home	=>	'/home/suadmin',
managehome	=>	true,
shell	=>	'/bin/bash',
}		

Important Concepts - Modules

A module is a combination of resources that provide some type of functionality.

```
class splunk inherits splunk::params {
    $config_vars = {
        version => $splunk::params::version,
        splunk_user => $splunk::params::splunk_user,
        splunk_password => $splunk::params::splunk_password,
    }
    package { 'splunk':
        ensure => $splunk::params::version,
        require => [
            Apt::Source['tkreiner-app-repo'],
            Exec['apt_update'],
        ],
        }
}
```

Important Concepts - Node

A node tells Puppet which configurations to apply to each of the agent nodes that connect. # Splunk Servers
node /^splunk-standalone/ {
 include role::splunk_standalone
}
node /^splunk-clustermaster/ {
 include role::splunk_cm
}
node /^splunk-cmpeer/ {
 include role::splunk_cmpeer
}

Puppet Repo Demo

UG Demo Install

Using Vagrant, we are going to provision 4 servers to form a Splunk multi site cluster.

splunk-cmpeer2

Port 8002

splunk-cmpeer3 Port 8003

Vagrant Configuration

```
Vagrant.configure("2") do |config|
config.vm.box = "ubuntu/bionic64"
config.vm.synced_folder "../provision/", "/provision"
```

```
config.vm.define "splunk-clustermaster", primary: true do |box|
   box.vm.hostname = "splunk-clustermaster-ugdemo"
   box.vm.network "private_network", type: "dhcp", virtualbox__intnet: "intnet"
   box.vm.network "forwarded_port", guest: 8000, host: 8000
end
```

```
(1..3).each do |i|
config.vm.define "splunk-cmpeer#{i}" do |box|
box.vm.hostname = "splunk-cmpeer#{i}-ugdemo"
box.vm.network "private_network", type: "dhcp", virtualbox__intnet: "intnet"
box.vm.network "forwarded_port", guest: 8000, host: (8000+i)
box.vm.provision "shell", inline: "/provision/set_attribute.sh splunk_site site#{(i % 3)+1}"
end
```

```
end
```

config.vm.provision "shell", inline: "/provision/puppet install.sh"

end

Vagrant Provisioning Demo

Lesson #1 – Do Not Touch system/local

- Having Puppet manage configs in the system/local directory is a BAD idea.
- Splunk and Puppet will continuously fight.
- Example Setting an indexer in detention causes a change in system/local/server.conf. Puppet detects the change and undoes it.

RESOLUTION

• Use application folders to manage configs. And...

32616	Splunkd	%CPU USEP		0 used. 615976 avail the	\sim
32695	tcpdump	0.3 splunk	UID 1000	TIME+ SMEN PR NI VIRT PES	APLURA
590	named	0.3 tcpdump 0.3 named	72	0:02.45 0.7 20 0 135356 43956 8946 5 1 1300 plust 300 100 100	
1002	VIM	0.3 dan	1028	0:00.08 0.6 20 0 152828 5248 534 5 1 25 mm 35 5 mm	Many Solutions, One Goal.

Lesson #2 – Add "puppet" to app name

- Lesson #1 tells us to use applications to manage configs.
- When naming the application folder, use a naming convention that tells you that Puppet manages the app.

Example: puppet_cm_config

Lesson #3 – Use Hashed Values

- When configuring sensitive information, (ssl_password, pass4SymmKey, etc.), make sure to have Puppet use hashed values.
- If you push a clear text password, Splunk will eventually convert it to a hashed value. However, Puppet will set it back when it detects a change in the file.
- This can cause Splunk to restart at times that you don't expect. Example: pushing a new index to a cluster will cause a restart.

Lesson #4 – Beware of Service Starts

- Puppet can ensure that your Splunk service has started.
- This means that Puppet will ALWAYS make sure that Splunk is running.
- Beware of this, particularly if you are trying to decommission Splunk indexers. After an offline, Puppet may try to restart Splunk.

RESOLUTION

• You can use "puppet agent --disable" to disable the Puppet agent from running.

Lesson #5 – Managing SHC Members

- Managing configurations in a search head cluster is tricky.
- Lesson #1 tells us to use apps to deploy configurations through apps. If you create an app in etc/apps in a SHC, the Deployer will remove it on the next bundle push.

RESOLUTION

- Create the app in etc/apps and put all of your configs in the app's local directory.
- Create the same named app in Deployer. It will push all changes to the app's default directory.
